ASTAS: Autonomous Surveillance & Threat Assessment System

Show Image

Show Image

🎯 Project Overview

ASTAS is an intelligent surveillance system that combines Computer Vision, Signal Processing, and Large Language Models to detect, analyze, and reason about potential threats in real-time. Inspired by DRDO border surveillance systems, this project demonstrates autonomous monitoring capabilities.

🧠 System Architecture

```
Camera/Sensor Simulation
        ↓
Computer Vision Module
        ↓
Signal & Event Analyzer
        ↓
LLM Reasoning Engine
        ↓
Decision/Alert/Control Output
```

✨ Key Features

- **Multi-Modal Detection**: Object detection, motion tracking, thermal analysis
- **Signal Processing**: IMU, LiDAR, audio signal analysis
- **AI-Powered Reasoning**: LLM-based threat assessment using fine-tuned models
- **Real-Time Processing**: Optimized for low-latency decision making
- **Autonomous Control**: PID controllers and trajectory planning
- **Comprehensive Visualization**: Live monitoring dashboard

🚀 Quick Start

Installation

```bash
```

```
# Clone the repository
git clone https://github.com/yourusername/ASTAS.git
cd ASTAS

# Create virtual environment
python -m venv venv
source venv/bin/activate  # On Windows: venv\Scripts\activate

# Install dependencies
pip install -r requirements.txt
```

Running the System

```bash
# Run complete simulation
python main.py

# Run individual modules
python -m cv.object_detection
python -m llm.inference.decision_engine
python -m simulation.env_sim
```

🔬 Technical Details

Computer Vision Pipeline

- **YOLOv8** for object detection
- **DeepSORT** for multi-object tracking
- **Optical Flow** for motion analysis
- **Thermal imaging** support

LLM Integration

- Base Model: LLaMA 2 / Mistral 7B / Phi-2
- Fine-tuning: LoRA (Low-Rank Adaptation)
- Quantization: 4-bit for efficient inference
- Custom threat assessment prompts

Signal Processing

- IMU data fusion (accelerometer, gyroscope)
- LiDAR point cloud processing
- Audio signature analysis
- Temporal pattern recognition

Control Systems

- PID controllers for camera positioning
- Trajectory planning for autonomous navigation
- Multi-agent coordination support

📊 Performance Metrics

- Detection Accuracy: >90%
- Processing Latency: <100ms
- False Positive Rate: <5%
- Threat Assessment Time: <200ms

🛠️ Configuration

Edit `config/config.yaml` to customize:

- Camera parameters
- Detection thresholds
- LLM model selection
- Alert sensitivity levels

📚 Documentation

Detailed documentation available in `/docs`:

- System Architecture
- Algorithm Details
- API Reference
- DRDO Proposal Draft

🧪 Testing

```bash
# Run all tests
pytest tests/

# Run with coverage
pytest --cov=. tests/
```

🤝 Contributing

Contributions are welcome! Please read our contributing guidelines and submit pull requests.

📄 License

This project is licensed under the MIT License - see LICENSE file for details.

🙏 Acknowledgments

- Inspired by DRDO border surveillance systems
- Built with open-source computer vision and AI tools
- Special thanks to the research community

📧 Contact
